AB Open reading frame expressed sequences tags (ORESTES) differ from conventional ESTs by providing sequence data from the central protein coding portion of transcripts. A total of 696,745 ORESTES sequences were generated from 24 human tissues and a subset of the data that correspond to a set of 15,095 full-length mRNAs used as a means of assessing the efficiency of the strategy and its potential contribution to the definition of the human transcriptome. It was estd. that ORESTES sampled over 80% of all highly and moderately expressed, and between 40% and 50% of rarely expressed, human genes. In the most thoroughly sequenced tissue, the breast, the 130,000 ORESTES generated are derived from

transcripts from an estd. 70% of all genes expressed in that tissue, with an equally efficient representation of both highly and poorly expressed genes. In this respect, the capacity of the ORESTES strategy both for gene discovery and shotgun transcript sequence generation significantly exceeds that of conventional ESTs. The distribution of ORESTES is such that many human transcripts are now represented by a scaffold of partial sequences distributed along the length of each gene product. The exptl. joining of the scaffold components, by reverse transcription-PCR, represents a direct route to transcript finishing that may represent a useful alternative to full-length cDNA cloning. [This abstr. record is one of many records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.].

AB A set of 15,247 unique oligo(dT)-primed cDNA clones (NIA Mouse 15K) based on 52,374 3'-expressed sequence tags (ESTs) has been made available for expression profiling in mouse models. To verify clone identity and obtain protein-coding information, the cDNA clones were resequenced, with an av. insert size of 1.5 kb, from both 3' and 5' ends (GenBank Accession Nos. BG062929-BG088954). Of 13,968 clones that were verifiable, 4.1% had correctable addressing errors or ambiguous addresses. Using all available sequence information to characterize the cDNA clone set indicated that up to 75% of mammalian genes in the public database are included in this set, and the remaining 3653 ESTs very likely represent novel genes that can be studied by expression profiling with the 15K microarray. All available information about individual cDNAs in this cDNA microarray are available through NCBI and MGD and in an ORACLE relational database accessible through the web site http://lgsun.grc.nia.nih.gov/cgi-bin/pro1. [This abstr. record is one of 6 records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.].

LANGUAGE: English
AB Complementary DNA microarray technol. has been increasingly used to monitor global gene expression patterns in various tissues and cell types. However, applications to mammalian development have been hampered by the lack of appropriate cDNA collections, particularly for early developmental stages. To overcome this problem, a PCR-based cDNA library construction method was used to derive 52,374 expressed sequence tags from pre- and peri-implantation embryos, embryonic day (E) 12.5 female gonad/mesonephros, and newborn ovary. From these cDNA collections, a microarray representing 15,264 unique genes (78% novel and 22% known) was assembled. In initial applications, the divergence of placental and embryonic gene expression profiles was assessed. At stage E12.5 of development, based on triplicate expts., 720 genes (6.5%) displayed statistically significant differences in expression between placenta and embryo. Among 289 more highly expressed in placenta, 61 placenta-specific genes encoded, for example, a novel prolactin-like protein. The no. of genes highly expressed (and frequently specific) for placenta has thereby been increased 5-fold over the total previously reported, illustrating the potential of the microarrays for tissue-specific gene discovery and anal. of mammalian developmental programs. The sequences of the expressed sequence tags are available in the GenBank database at Accession Nos. AW537829-AW545916, AW535144-AW537732, AW545922-AW559162, and AF272368. AB The invention provides isolated nucleic acids mols., designated 56634 nucleic acid mols., which encode novel **phosphatidylinositol 4-phosphate 5-kinase** members. The cDNA sequence and the encoded amino acid sequence of a human **phosphatidylinositol 4-phosphate 5-kinase** homolog 56634 (clone Fbh56634FL) are disclosed. Tissue-specific expression profiles, and structural motifs of the polypeptide are provided. The invention also provides **antisense** nucleic acid mols., recombinant expression vectors contg. 56634 nucleic acid mols., host cells into which the expression vectors have been introduced, and nonhuman transgenic animals in which a 56634 gene has been introduced or disrupted. The invention still further provides isolated 56634 proteins, fusion proteins, antigenic peptides and anti-56634 antibodies. Diagnostic methods utilizing compns. of the invention are also provided.

AB A human **phosphatidylinositol-4-phosphate 5-kinase** and cDNA and sequence homologs thereof are disclosed. The mRNA expression profile in various human tissues is provided. Methods for expressing and prepg. related products using recombinant cells are described. These recombinant cells, the enzyme, or nucleic acids encoding the enzyme are useful in screening for modulators of the enzymic activity or gene expression. Methods of screening for its modulators and using them for the treatment of various disease and their effectiveness (in vivo testing of compds./target validation) are described. Reagents that regulate human **phosphatidylinositol-4-phosphate 5-kinase** and reagents which bind to human **phosphatidylinositol-4-phosphate 5-kinase** gene products can play a role in preventing, ameliorating, or correcting dysfunctions or diseases including, but not limited to, cancer, asthma, and COPD.

AB This invention relates to the discovery of nucleic acids assocd. with cell proliferation, cell cycle arrest, cell death, and aging-related diseases such as progeria and Werner syndrome. Such sequences can be used to det. the aging status of a cell population, e.g., whether a cell is aging or is undergoing senescence. Moreover, the present invention provides sequences indicative of the proliferation state or youth of a cell. In addn. the present invention provides sequences assocd. with the aging of skin cells and, in particular, fibroblast cells. The isolated nucleic acids can be used to det. the aging status of a cell population. In addnl., they can also be targeted and their level of expression altered by, for example, gene therapy methods. Such methods can be used to slow or stop the aging process of the cell population, to arrest the growth of a proliferating cell population such as a tumor cell population, to promote division in cells which are prematurely arrested, to det. that a cell population is healthy and rapidly dividing, and to det. that a cell population is not dividing and proliferating. Further, the present invention provides isolated nucleic acids assocd. with cyclin A.

AB This invention relates to the discovery of nucleic acids assocd. with cell proliferation, cell cycle arrest, cell death, and aging-related diseases such as progeria and Werner syndrome. Such sequences can be used to det. the aging status of a cell population, e.g., whether a cell is aging or is undergoing senescence. Moreover, the present invention provides sequences indicative of the proliferation state or youth of a cell. In addn. the present invention provides sequences assocd. with the aging of skin cells and, in particular, fibroblast cells. The isolated nucleic acids can be used to det. the aging status of a cell population. In addnl., they can also be targeted and their level of expression altered by, for example, gene therapy methods. Such methods can be used to slow or stop the aging process of the cell population, to arrest the growth of a proliferating cell population such as a tumor cell population, to promote division in cells which are prematurely arrested, to det. that a cell population is healthy and rapidly dividing, and to det. that a cell population is not dividing and proliferating. Further, the present invention provides isolated nucleic acids assocd. with cyclin A.

AB Open reading frame expressed sequences tags (ORESTES) differ from conventional ESTs by providing sequence data from the central protein coding portion of transcripts. A total of 696,745 ORESTES sequences were generated from 24 human tissues and a subset of the data that correspond to a set of 15,095 full-length mRNAs used as a means of assessing the efficiency of the strategy and its potential contribution to the definition of the human transcriptome. It was estd. that ORESTES sampled over 80% of all highly and moderately expressed, and between 40% and 50% of rarely expressed, human genes. In the most thoroughly sequenced tissue, the breast, the 130,000 ORESTES generated are derived from

transcripts from an estd. 70% of all genes expressed in that tissue, with an equally efficient representation of both highly and poorly expressed genes. In this respect, the capacity of the ORESTES strategy both for gene discovery and shotgun transcript sequence generation significantly exceeds that of conventional ESTs. The distribution of ORESTES is such that many human transcripts are now represented by a scaffold of partial sequences distributed along the length of each gene product. The exptl. joining of the scaffold components, by reverse transcription-PCR, represents a direct route to transcript finishing that may represent a useful alternative to full-length cDNA cloning. [This abstr. record is one of many records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.].
